Temperature Max (F)
Temperature Min (F)
Solar Radiation (MJ/m^2/day)

Silver Tip
Full Bloom
Petal Fall

12.4 mm
15 mm
21.0 mm

10 mm king bloom
6 mm side bloom
14.1 mm
MaluSim Carbohydrate Model for Piney River, VA
May 28, 2013

- Recorded Data
- 4-day Running Average

Key:
- Silver Tip
- Full Bloom
- Petal Fall
- 10 mm King Bloom
- 6 mm Side Bloom
- 12.4 mm
- 14.1 mm
- 21 mm
- 15 mm
Interpreting the MaluSim Model: look for three-to four-day trends

<table>

Suggestions for late thinning and return bloom applications

Posted on May 21, 2013 by gmp@vit.edu

By this time, apples in most of Virginia are 13-20 mm in fruit size. Once apples reach this size, the trees tend to be less responsive to the typical 10 mm (carbaryl or NAA or 6-BA) applications. However, if additional thinning is needed, growers can still use ethephon (sold under the trade names Ethrel and Ethephon 2). Ethephon is most effective when fruit size is 14 to 28 mm in diameter. In most years, it is difficult to chemically thin apples larger than 24 mm.

Ethephon has variable responses due to air temperature and humidity, as well as spray water volumes. Overtinning is more likely with this material than with other thinners. For this reason, ethephon has been primarily used when earlier thinning applications were not successful, or very difficult to thin cultivars, and/or when return bloom has been a severe problem. Thinning results with ethephon varies among cultivars.

Ethephon is not very effective on Gala, but it is very effective on Golden Delicious and Rome. Where water is alkaline, buffering the spray solution to a pH of 3 to 5 will increase chemical stability and effectiveness. Do not use before a light rain or dew or when post-application temperatures are predicted to be greater than 90°F because excessive thinning may occur.

Ethephon is usually combined with carbaryl or oxamyl (Vydate L). For greater thinning activity, ethephon can also be tank mixed with NAA and/or spray oil.

I have several research trials underway to look at alternative and hopefully more consistent late thinning materials. However, at this time, ethephon is still the standard material when fruit size is greater than 14 mm.

Once fruit is larger than 28 mm, hand thinning will need to be removed additional fruit. Hand thinning will have a positive impact on final fruit size and return bloom for up to about 45 days after full bloom. In 2013, this is around the first week of June for central Virginia and the second week of June for the Winchester area.

PROMOTING RETURN BLOOM IN APPLE

Ethephon (sold under the trade names Ethrel and Ethephon 2) can promote flower bud formation when applied from petal fall to about 6 to 8 weeks after full bloom. The greatest effect is from applications made 0 to 4 weeks after bloom. However, since ethephon can cause substantial fruit thinning, multiple weekly applications at rates between 1/2 that of the thinning rate are recommended starting when fruits are greater than 30 mm. When possible, it is best to wait until after "June drop" has occurred. At a minimum, wait 7-10 days after the last thinning application.
